Stakeholders and Gaps

DUE: WED 10/7/26

Your approved candidate says who the product is for and what it does. That is a set of requirements, and it leaves things out. This is where you start working out who you need to gather requirements from and what you most need to find out. Using your evidence from Discussion 05:

1. **Your requirements.** List what your product must do, as your team understands it today. One line each.
 - a. As our team understands it, our product must be able to gather information on multiple forms of public transportation local to an area and then sort the available options by cost.
2. **Who has a stake.** List the groups with a stake in your product other than the people who use it. For each, say what they could want from it. (Discussion 05, Q1 and Q3)
 - a. Group 1: Transport App Drivers (Uber, Lyft)
 - i. What they could want: Drivers could want the service to give accurate travel times, route information, and pickup locations to give their riders the best estimates possible.
 - b. Group 2: Public Transportation Operators (Public buses, Subway Stations)
 - i. What they could want: Public transportation operators could use the service to make accurate schedules, let users know how much the fare is, plan routes for the day, report delays, and let the users know of any updates.
3. **What is missing.** Criticize your list for what it leaves unstated. Include the qualities nobody asks for by name, such as security, performance and reliability. (Discussion 05, Q4)
 - a. Cost Data - where would the cost estimates come from?
 - b. Range and Data Collection - is this operating at a citywide, statewide, national, or global range? If I was planning a trip overseas could I use the aggregator to determine the most cost effective mode of transport? If so, how would that data be collected
 - c. Data Verification - how do you know if those numbers are accurate and how will they be updated if things change(for example: the public subway is delayed or traffic is jammed)?
 - d. Criteria for Modes of Transport - will the aggregator be able to sort modes of transportation based on factors other than costs such as efficiency or speed?
4. **What it would cost.** Rank what is missing by what it would cost to find out late. For the top three, say what finding out late would cost your team. (Discussion 05, Q4)

- a. Cost Data - the purpose of this aggregator is to provide users with the ability to rank methods of transportation via cost, if we don't know where the cost estimates for our project would come from we don't have a core piece of our project. This would most likely be the biggest cost to our project.
 - b. Data Verification - having inaccurate data would throw off the entire project, while we would still have the basic structure of the project handled, not having accurate data would throw the project into disarray.
 - c. Range and Data Collection - the core function of our project is providing cost estimates for transportation, if we don't know how big of a scale we are working with, as long as we have the bare minimum scale, scaling up would be a hassle but not that big a cost for the team.
 - d. Criteria for Modes of Transport
5. **Who you will not ask.** Name at least one group your product affects that your team does not intend to consult. Say why, and what you risk by not asking. (Discussion 05, Q5)
- a. We do not intend on asking residents across the U.S. about where or how they intend on using our service. Our team is too small, does not have the resources for long distance travel, and we do not have the time it would take to interview various residents across the U.S.
 - b. What we risk by not asking: We could increase traffic on routes and residential areas creating congestion for the people who live in that community. We could also miss things like road closures or streets that are unsafe or too difficult to travel down by not traveling and meeting with people across the U.S.
